# El algoritmo: *Visual Pattern Mining* (VPM)

IA-ML

- **Fase 1 (Morfológica):** el algoritmo recibe el parche que indica que un subconjunto de esa imagen es el objeto que se busca, entonces el algoritmo clasifica partes del parche como pertenecientes al objeto de interés o no.
- **Fase 2 (Macro morfológica):** el algoritmo establece relaciones espaciales entre estas partes clasificadas para formar el objeto de interés y clasificarlo correctamente en su totalidad.
- **Fase 3 (Espectrométrica):** Para evaluar el impacto, se tiene un segundo modelo que sólo indica si la espectrometría corresponde a un elemento que tiene alto, medio o bajo impacto. (12 bandas espectrales)
