

How do we motivate Action?

A Transition is coming, one way or another.

A little journey

Maybe a “thought experiment” in what LbD describes as action for Transitions – a model based on words for cooperative domestic action.

How did we start?

- We started with a simple question:
 “‘How would a ‘Good Life’ be in 2050?’”
- This is kind of like asking how you’d like to live in 2050, but there are some restrictions
 - It must be in a carbon-neutral context—or in a 2-1.5° emissions envelope;
 - It must be adapted to climate impacts of 2-1.5°;
 - It must be attractive
- The Transition is a journey. And we’re late.

How do we map the transition?

- If we focus on **direction** and **trajectory**, we lose position—where we are, what’s around us
- If we focus on **position**, we lose direction—where things are going, where they’ve been, and where they could go
- **We have to keep both perspectives in mind**

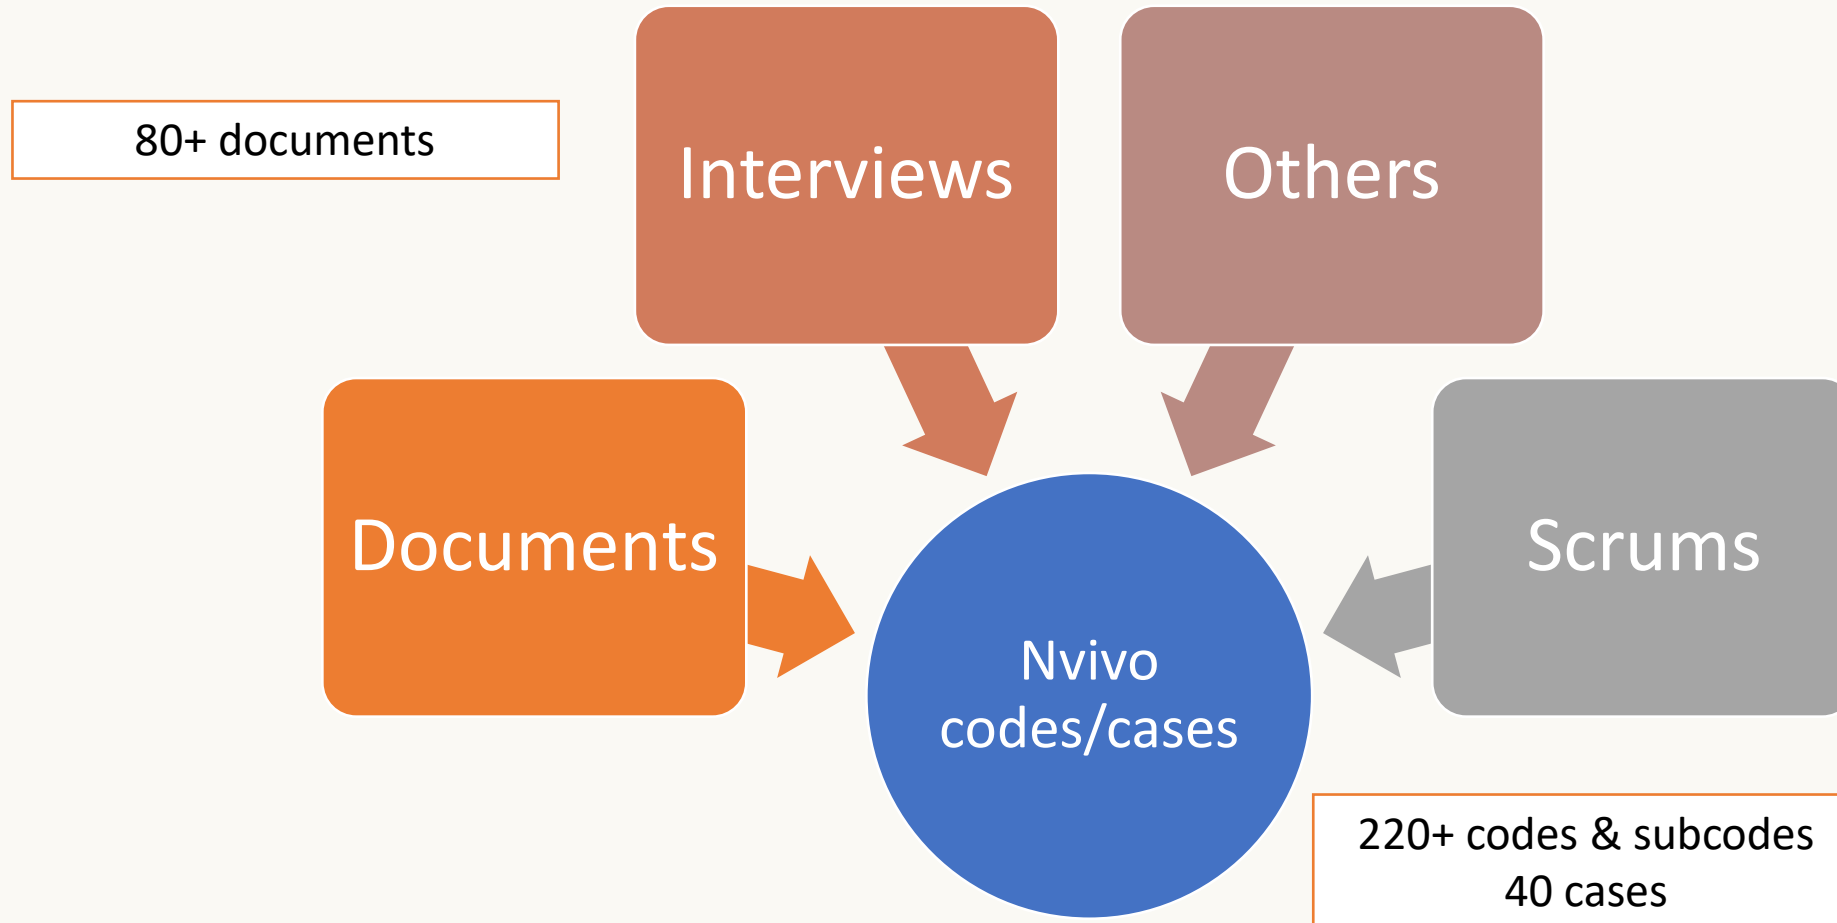

The LbD Process

- We don't start from a trajectory, or from emissions metrics, but from a **vision** of what we want in 2050.
 - This anchors coherence over time
- The Narrative is an imagined journey to the vision
 - Steps and milestones to walk us to the vision
 - Not an open-ended narrative

Our Starting Period	The Narrative	The Vision
Initial conditions	"Stepping Stones"	2-1.5°
		Convivial, Dignified

Nvivo coding

MODELING GROUP

There is an assumption that there is a sense of a good everywhere - how this is addressed in specific places
 There is also a sense of inertia - people not necessarily where are the inflexion points
 We will also need some of the discussions on macroeconomic decision making in change

Jose - if we could start thinking about specific areas we would look in a particular place.

Julia - what kind of model allows for real human decision there is a ceteris paribus approach, where we ignore the effects of systems modelling are you planning to use?

Steve - Community based design process - what is the willingness to pay for that. They you start pointing what do you see it happening - this is a place based design.

Andrew - Tools we have available are large sectoral and models are very good in technology and on specific areas are they for plotting emissions, but less good on plotting an emissions point of view, and then try to plot them on are planning to consider.

Another case is to start looking about how to use this for 2050 and then go back. The opposite of the process we

Jonghi a vision - two part. A vision for society will have society. Once you have a vision, there are consequences want to do a constrained analysis - what are the constraints something - one can do this at sectoral level. An idea a interstina - interventions that are trend breaking to move

Good Life – the notion

What did People Say?

- Originally we heard a *lot* of different things about the visions—some very specific to their country and area, others more general
 - 3-4 day work week, more time with elderly, more dancing, etc.
- Then we asked people to consider a ***Eutopia***, and not just a Utopia. So we're imagining a *real* place. And this refined things towards the narratives.
- We also asked them about a ***Dystopia*** in 2050
 - The terrifying thing is that in every country, Dystopia was direct from BAU
- People wanted things to *change* between now and 2050.

(We've heard about "change" before)

... so, how?

Las visions y narrativas están en www.learningbydoingproject.org ...

“How” for the Transition?

The project found a few of things, some of which we weren't expecting.

1. Looking at this as an economy-wide, carbon-pricing-based Transition would be *politically* catastrophic.
 - a) *Postponing* the politically catastrophic would be *economically* catastrophic.
2. If the Transition doesn't happen *fast*, we're in trouble (see above)
3. For the Transition to happen *fast*, it needs to be **attractive**.
4. “Technology” was not the most important element in the Transition
5. For the Transition to happen fast, *some* **facilitation** is necessary
6. “**Bottom-up**” unlocks many, many co-benefits, including **inclusion**.

How's "Technology" not so important?

Tech doesn't always explain itself

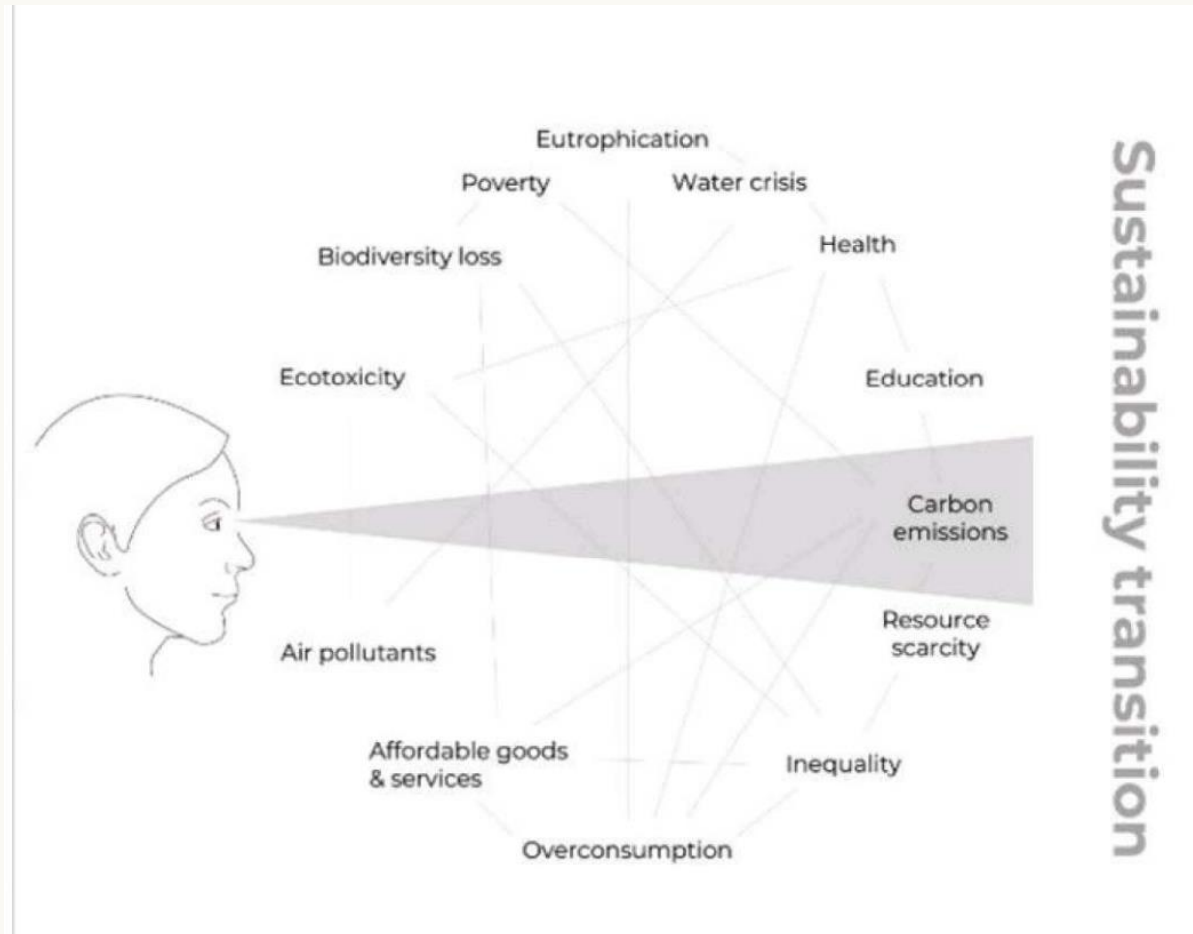

About “facilitation” in bottom-up

- It’s not just financial facilitation, though that will be necessary
 - Cognitive and experiential barriers
 - We need some orientation on new technology—be exposed to it
- It means implying overcoming practical uncertainties
 - Trying things out
 - Seeing a *direction of travel*, **testing it**, and understanding its benefits
 - Seeing that it collaborates to a “Good Life”, to “wellness with dignity”, to working with Nature
- *Then*, the financial mechanisms

A word about “Top-down” ...

- “Top-down” almost by definition we get into tunnel vision
 - About the design of the Project
 - About the aims of the Project—which normally are about emissions
- You often overlook co-benefits when looking at things “top-down”
- “Top-down” projects need to **import** innovation, as “tunnel vision” means that local innovation would not be prioritised.
- “Bottom-up” delivers opportunities for innovation and local economic benefits—more localised value-add, more local opportunity and inclusion

About “Top-down”

About “Bottom-up” and co-benefits

Visions and roadmaps for a good life in low-carbon societies. Santiago de Chile, 2023

Building blocks for (sub)sectors

- Orientation
 - Understanding new processes or technologies
- Facilitation
 - Cognitive, and financial support
- Bottom-up
 - Supports economic inclusivity
 - Allows for innovation and spread
 - Makes the measures digestible
 - Broader creation of opportunities
 - Agents have Motivation to Act
- Not necessarily one monolithic package of regulation
 - This plays to larger, more sophisticated actors
 - Aim regulation and guidance bottom-up
- Be aware of governance for actors, and the right signaling
 - long-term and short-term – position and direction, with KPIs (words and numbers)

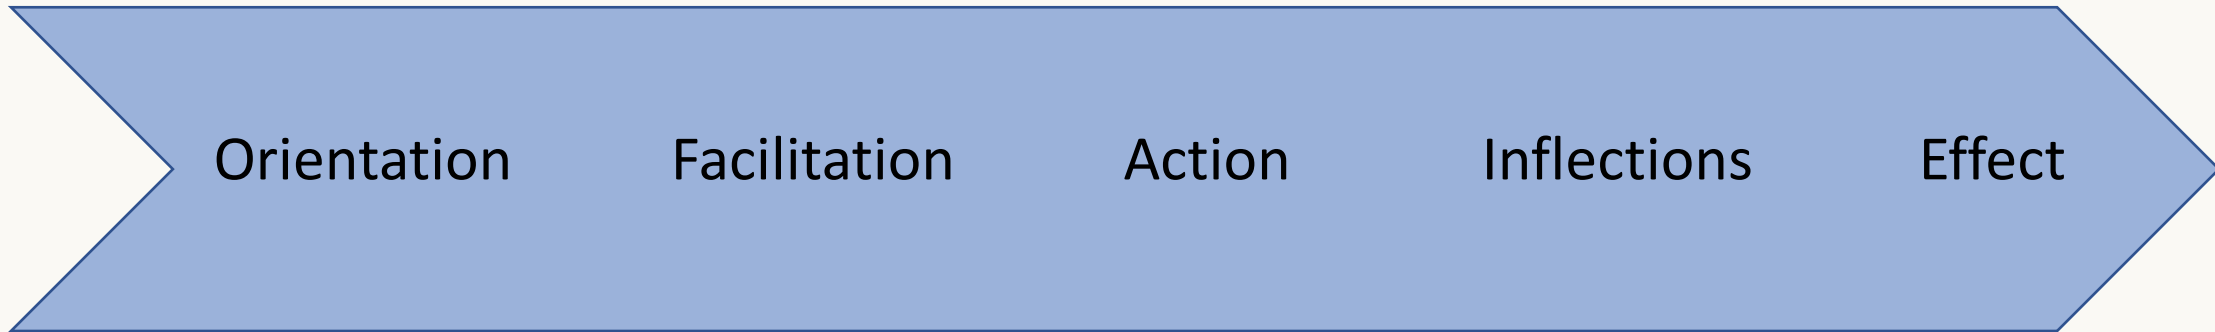

Bottom-up, Sectoral Transitions

(We only have time for *one* sector)

We looked Transitioning Transport

<p>Changes derive from introduction of new vehicle drive trains (ICEs are replaced hybrids, plug in hybrids, electrics, fuel cell, and hydrogen) plus addition of accompanying infrastructure (chargers and stations). Cargo shifts to trains, catenaries, hydrogen. Transport efficiency improves through improved road control and better fuels; transport needs are also avoided through shifts in work practices, and changes in urban environment requiring less transport. New cottage industries emerge to supply sector. Agents are users, importers, cottage industries (vehicle stock) and public sectors (charging and station infrastructure; roads and tracks). Self-financed (vehicle stock), blended (cargo) and bonds (infrastructure)</p>			
Immediately – 2022-2027	Short Term – 2028-2035	Medium Term – 2036-2040	Long Term – 2040-2050
Improvements on fuel quality and regulations for public transport	Replacement schedule for mandatory Internal combustion engine (ICE) vehicles in force and replacement continues and expands		Full replacement of ICE vehicles for electric built in equivalent
Programs for better use of climate friendly fuels	Replacement schedule for buses and cargo trucks with alternatives in force and replacement continues and expands		Most heavy goods cargo replaced by catenaries, hydrogen, trains, BRT, bicycles, trains and others replace use of local ICE in cities
Introduction of Bus rapid transit systems and announcement of congestion pricing and road control measures	Expansion to % tbd of road usage measures		Trains and EV only for longer distance travel
Introduction of programs and incentives for electric bicycle provision and roads	Further use of PHEV and EV and others advances		Most road usage re-ordered
Announcement of discussions for replacement schedule for Internal combustion engine	Expansion of residential charger use in major cities		City built environment and work practice transformed so as to use less transport

Pathways for Bottom-up, (sub)sectoral

Announcement of discussions for replacement schedule for Internal combustion engine	Expansion of residential charger use in major cities		City built environment and work practice transformed so as to use less transport

Pathways for Bottom-up, (sub)sectoral

Transition of the Transport Sector

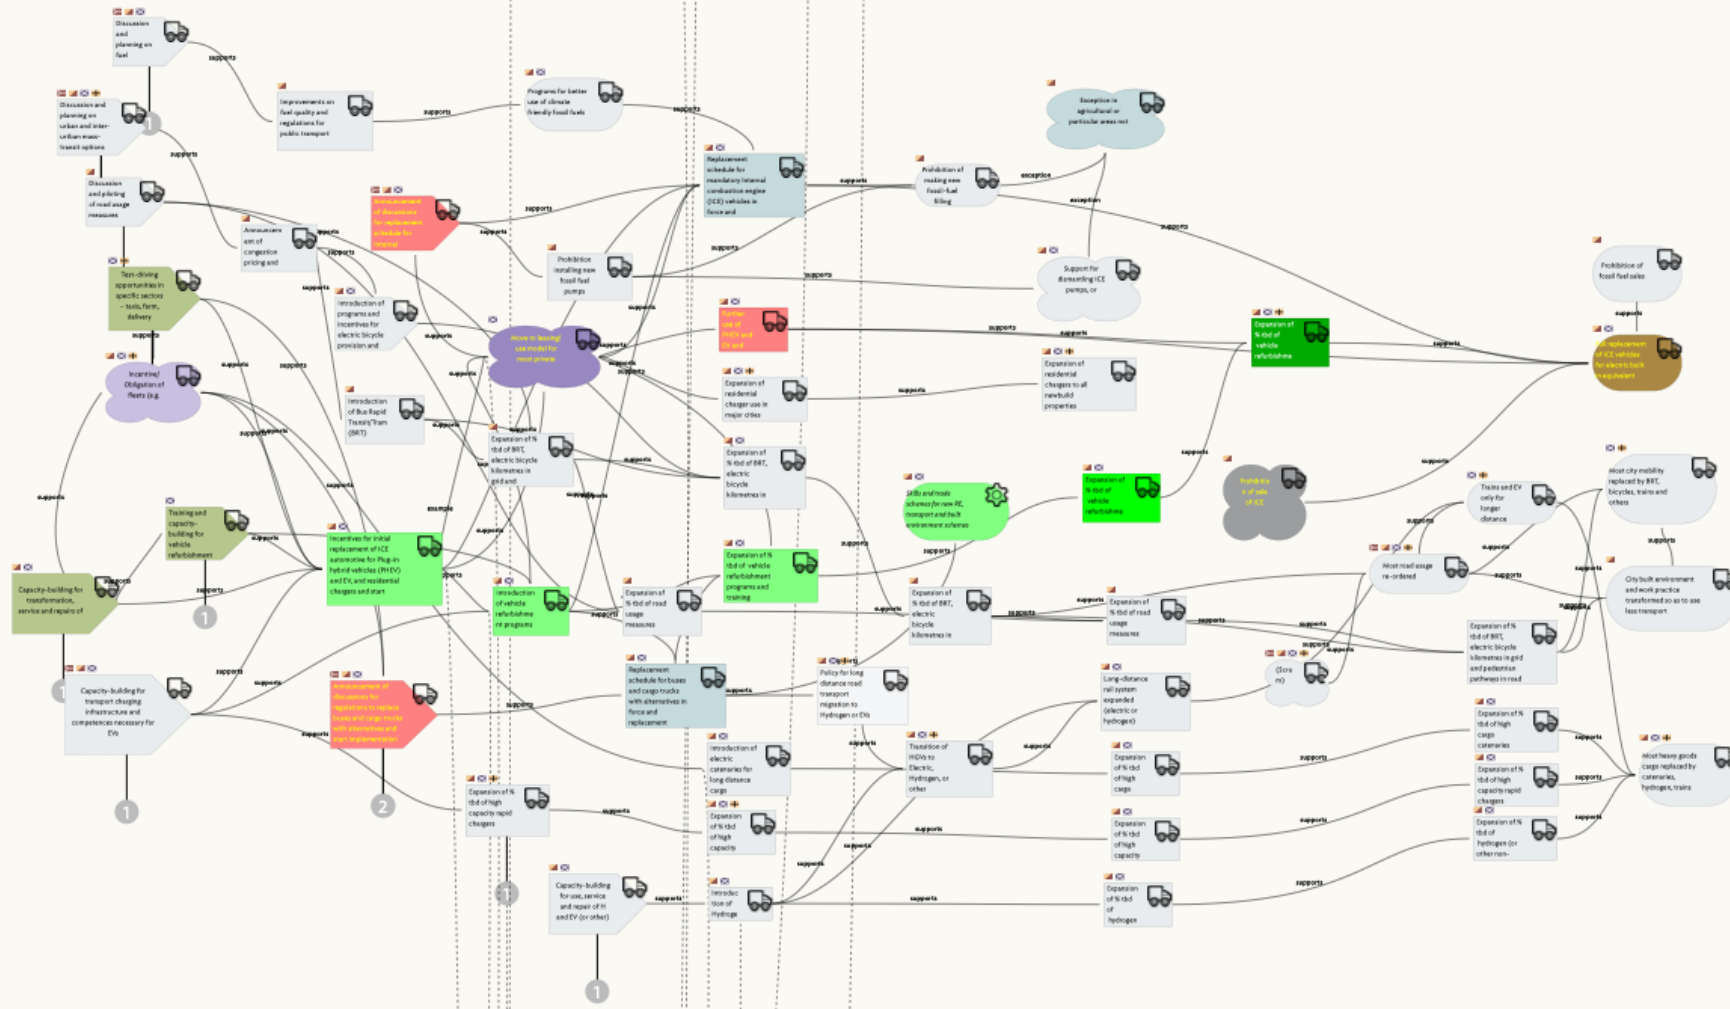

- **Transitions of Vehicles** – buses, cars, light-duty vehicles, etc.
 - This is the most visible part, and what many people focus on.
- **Fuel and energy for transport**
 - This is charging points, energy network, and alternative fuel distribution
 - This is more invisible, but the former simply won't work unless this moves
- **Urban and Suburban Mobility**
 - More a public, municipal and urbanistic consideration
 - *This* is the one that yields quality of life, as it means a reduction in traffic
- **Cargo and Long-distance Transport**
 - Involves infrastructure, but also with industrial logistics, which will evolve

Transition of the Transport Sector (e.g.)

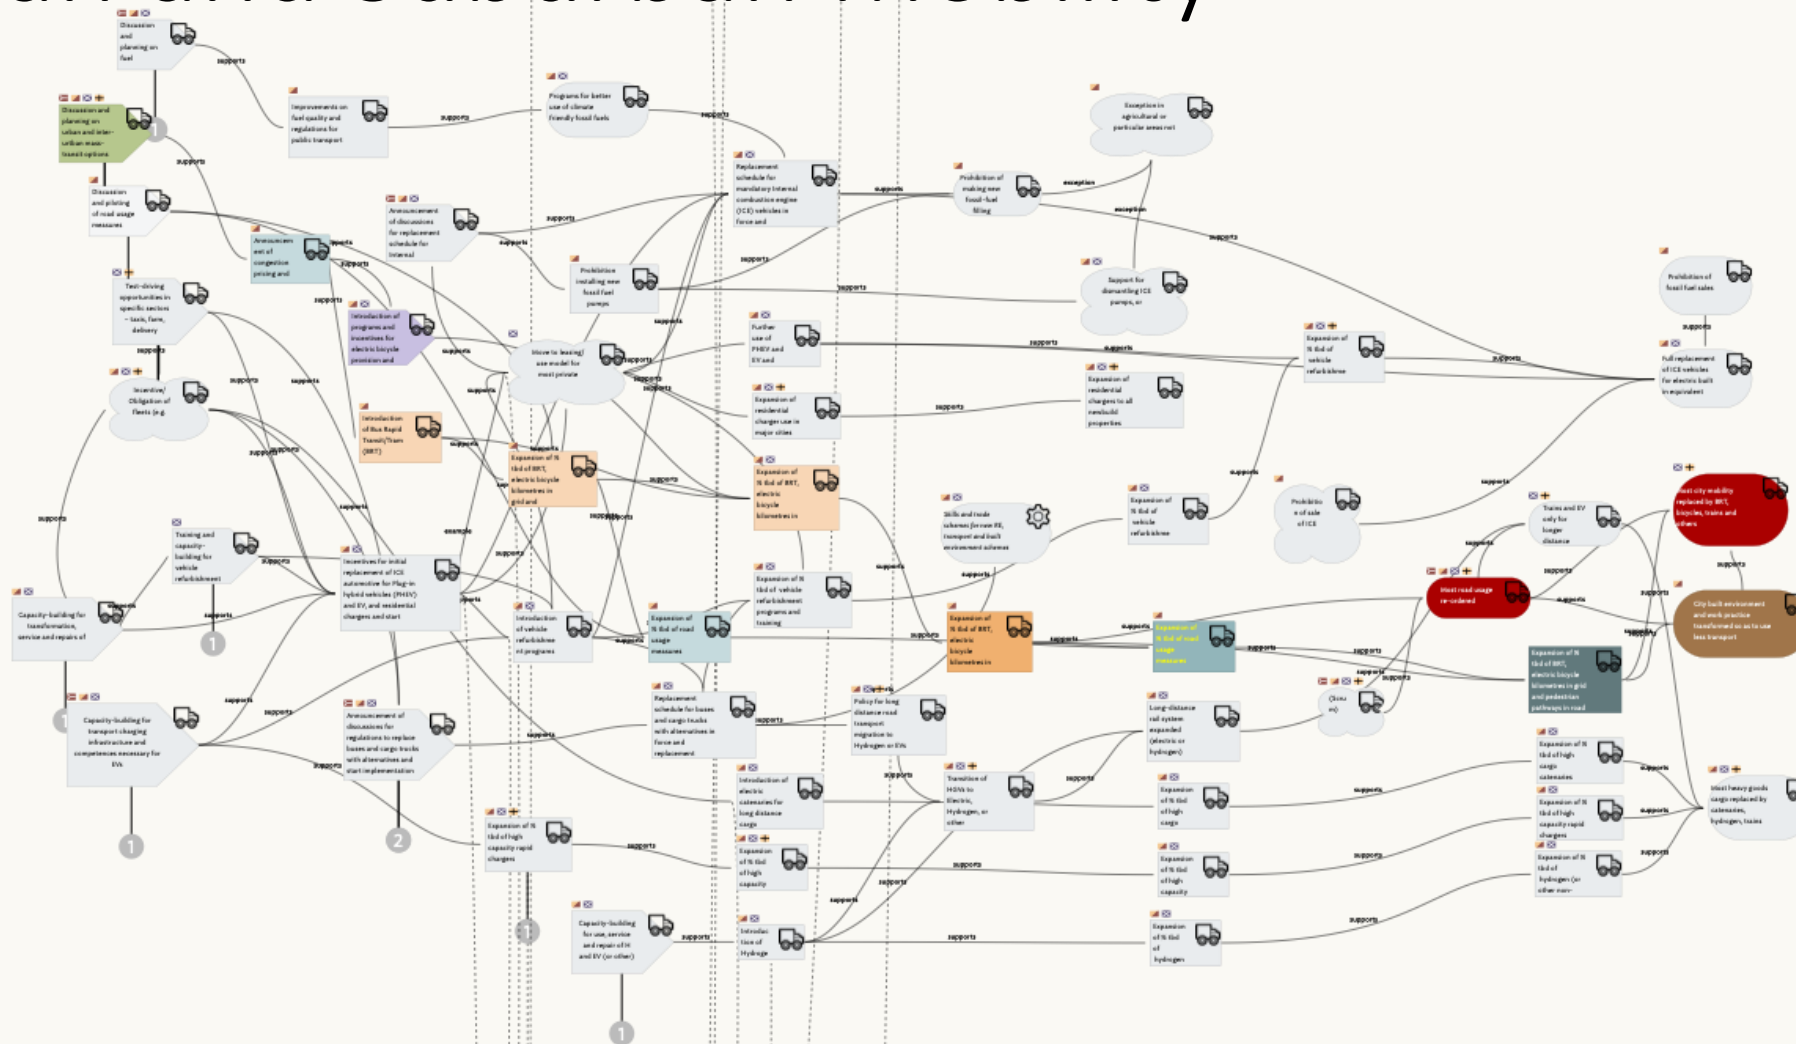

So, say in **Transition of Vehicles**:

- 2022-2027: **Prepare** – signaling of eventual transition away from ICE; incentives for initial replacements; incentives for charger rollout; capacity-building for retrofit/service/repair of EVs, introduction of facilitation for vehicle refurbishment/fleet transition; test-driving opportunities for fleets.
- 2025-2050: **Action** – Incentive/Obligation of fleets to transition
- 2028-2035: **Inflection** – Replacement schedule for buses, LDVs
- 2030-2040: **Inflection** – Leasing/use model for most private vehicles
- 2045-2060: **Effect** – Prohibition of sale of ICE vehicles

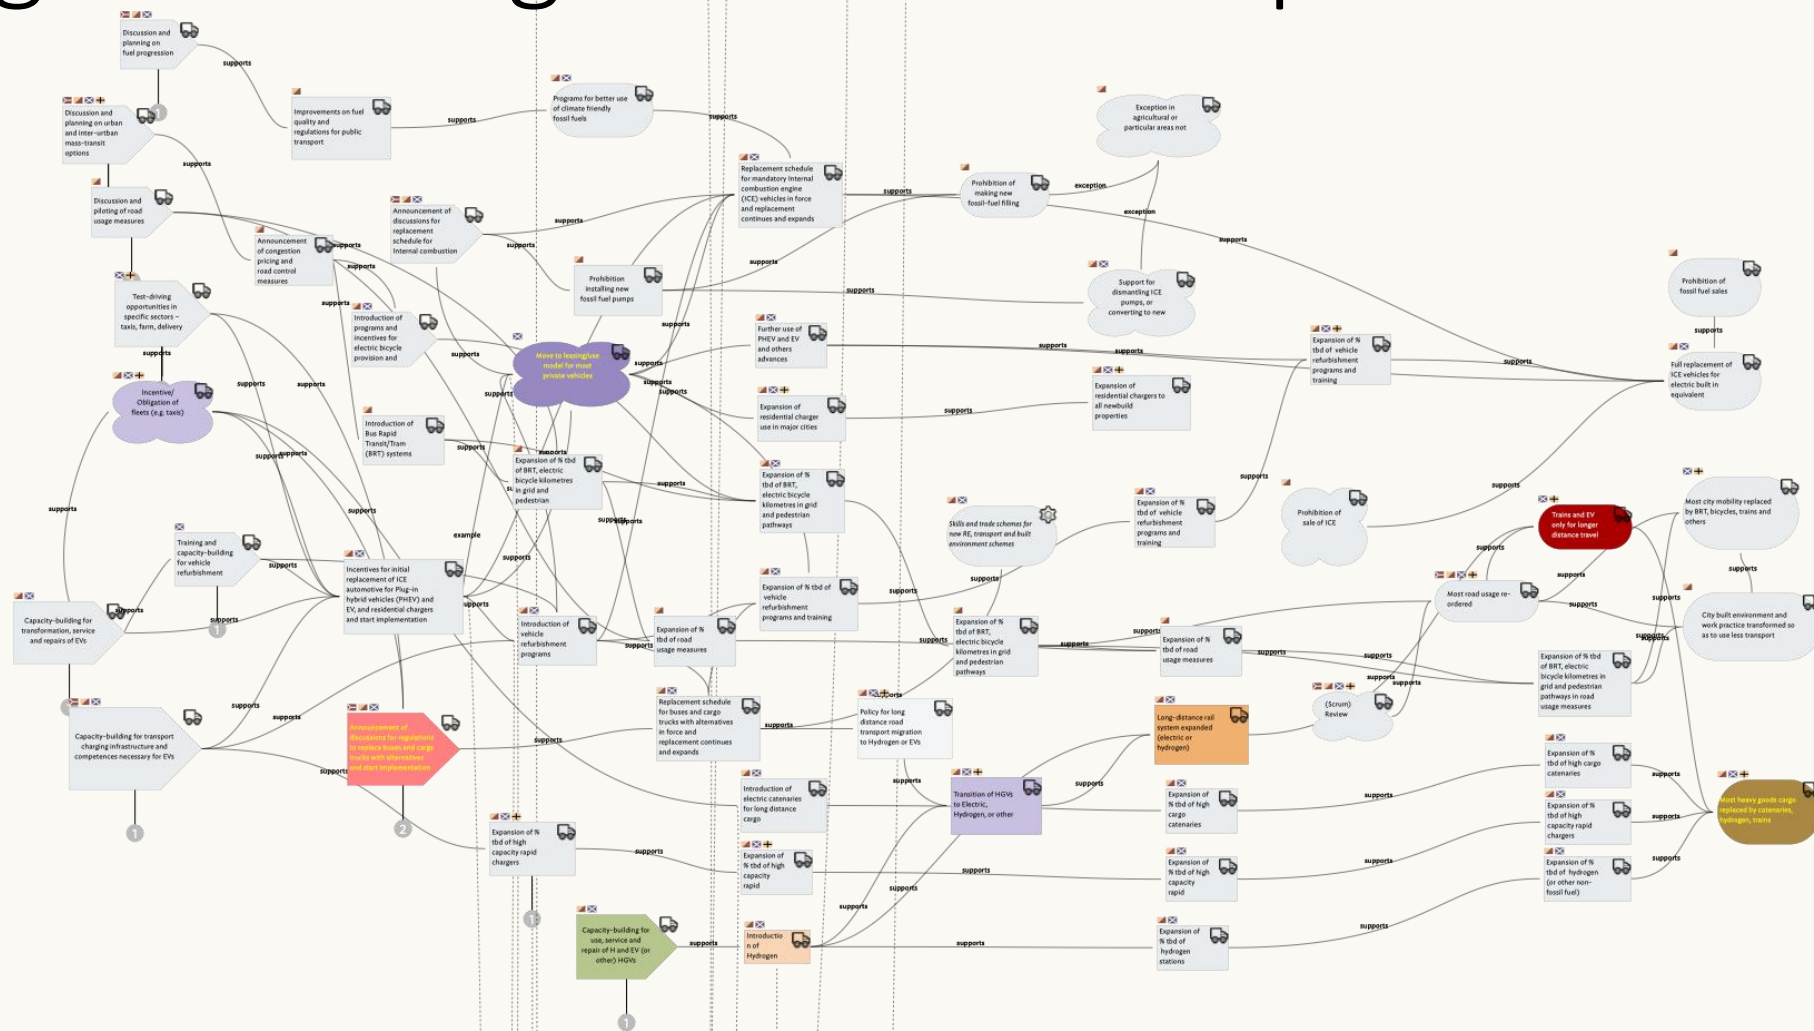

Transition of a Transport Sector: Transition of Vehicles

Transition of a Transport Sector: Urban and Suburban Mobility

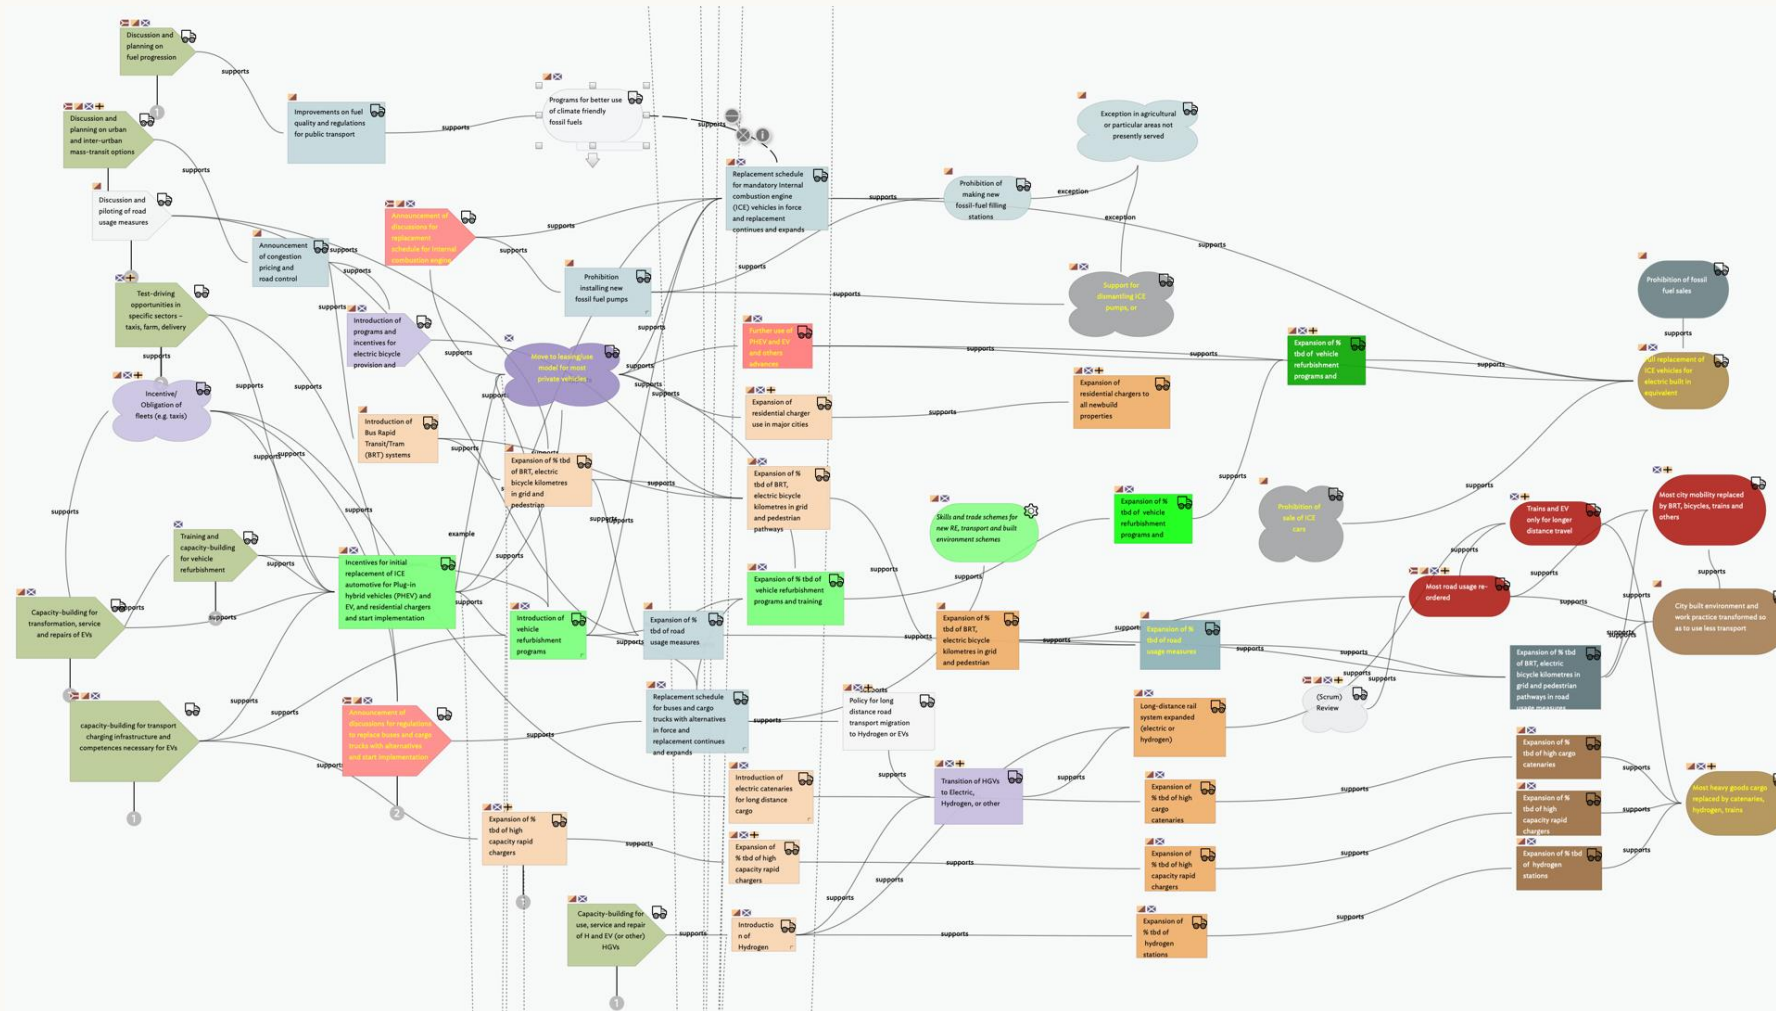

Transition of a Transport Sector: Cargo and Long Distance Transport

Transition of a Transport Sector

Other sectors...

Energy

- Transition of Electricity Generation
- Grid and Energy Infrastructure
- Distributed Power Generation
- Energy Efficiency

Food and AFOLU

- Forestry Conservation and AFOLU
- Agricultural and Agro-industry Practices
- Food, Food Waste
- Rural Adaptation and Resilience

Other Sectors...

Waste / Circular Economy

- Importation and Manufacturing Regulation
- Waste Sites and Waste Management
- Circular Economy Capacity and Infrastructure Waterfall

+Built Environment

Finance

- Development of Banking System
- Sensibilization of Private Financial Services Sector
- Development of Leasing and Financial Instruments
- Carbon Taxes and Carbon Budgets

+Industry

Building blocks for (sub)sectors

- Orientation
 - Understanding new processes or technologies
- Facilitation
 - Cognitive, and financial support
- Bottom-up
 - Supports economic inclusivity
 - Allows for innovation and spread
 - Makes the measures digestible
 - Broader creation of opportunities
 - Has agent Motivation
- Generate examples of success
 - “Role models”
 - Success stories
- Successes in Transition
- Success in delivering a “Good Life”
 - 2-1.5° trajectory
 - Husbandry of Nature
 - Attractive: “wellness with dignity”

Urban enviroment

Direction and Position in a complex journey

- Describe what is actionable bottom-up, so as to capture co-benefits and focus governance
- **Goal is of a “Good life” for each sub-sector.**
- **Orientation – Facilitation – Inflection – Effect**, at sub-sectoral levels, with various stakeholder-actors.

Thank you.

Gilberto Arias, Energeia.
