Cambio en la temperatura en México 1880-2021

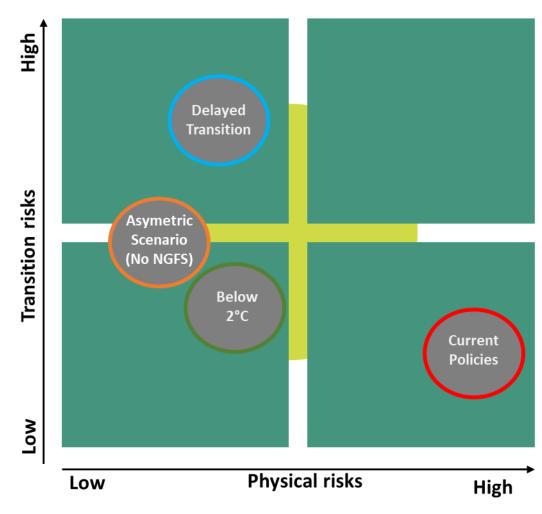

Source: Own elaboration based on data from Instituto de Investigación en Cambio Climático de la UNAM

Scenarios for Mexico approved by the Committee on Sustainable Finance (CSF):

- Below 2°C (NGFS)
- Current Policies (CP), >3°C (NGFS)
- Delayed Transition (NGFS)
- Asymetric Scenario (No NGFS) the rest of the world has Net Zero Emissions targets (1.5°) while Mexico continues
- with Current Policies.

NGFS scenarios framework

Positioning of scenarios is approximate, based on an assessment of physical and transition risks out to 2100.

Models suite

Shadow carbon price, energy and agricultural sectors

Transition risk model

GCAM

Greenhouse gas emissions, production and prices in the agricultural and energy sectors, socioeconomic assumptions

Physical risk model

Climrisk

Economic impact model

GEMMES

GCAM

Outputs: GHG emissions by economic sector, shadow carbon price, production and consumption by nine energies, electricity generation by technology, costs and prices, transportation services, energy used by transportation technology and fuel used, land use (e.g. biomass, cereals, forest), water extraction and consumption by sector and by basins, water prices and water costs by basins, among others.

Physical risk

Outputs: Vulnerability, impacts and risks at a spatial resolution of about 50km x 50km for the whole world. Combining probabilistic global climate change scenarios with local warming in urban areas produced by UHI to generate estimates of economic impacts of climate change and dynamic uni- and multivariate risk measures.

Macroeconomic model

GEMMES calibration

Balance of payments

Remittances

System of national accounts

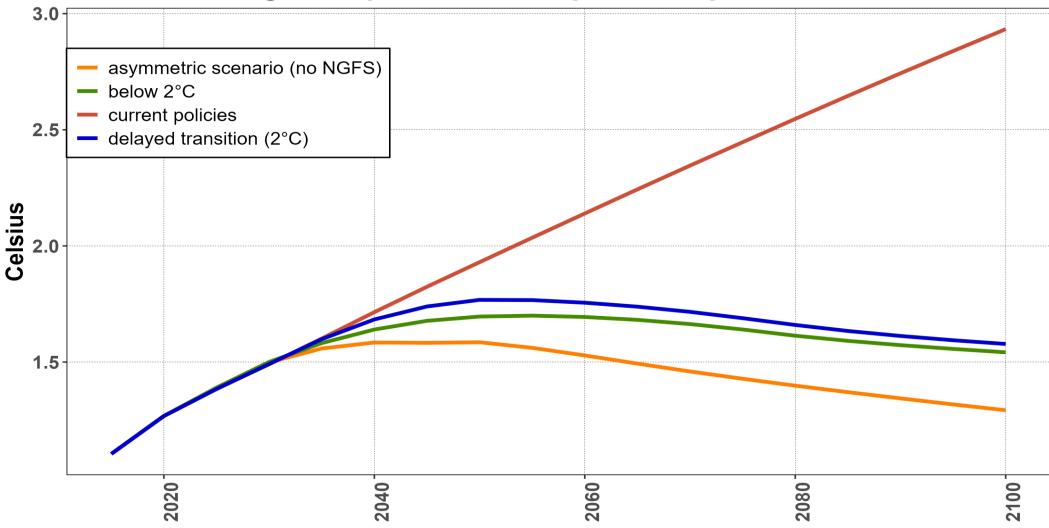

· Banking sector and central Banks

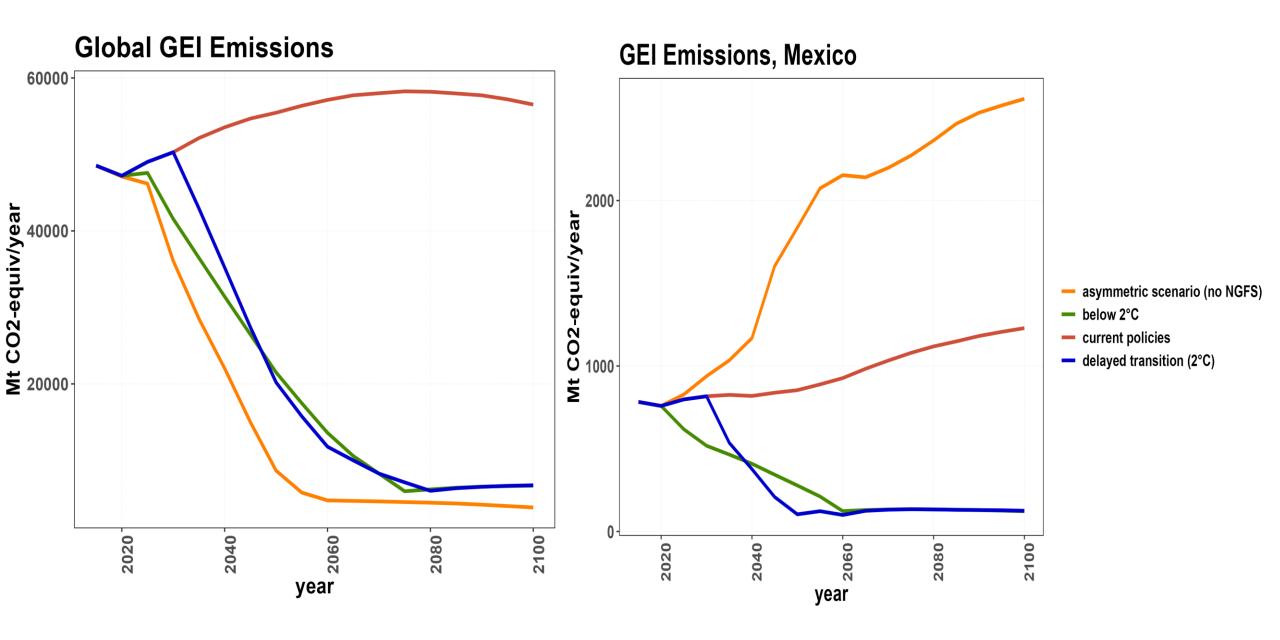

Data:

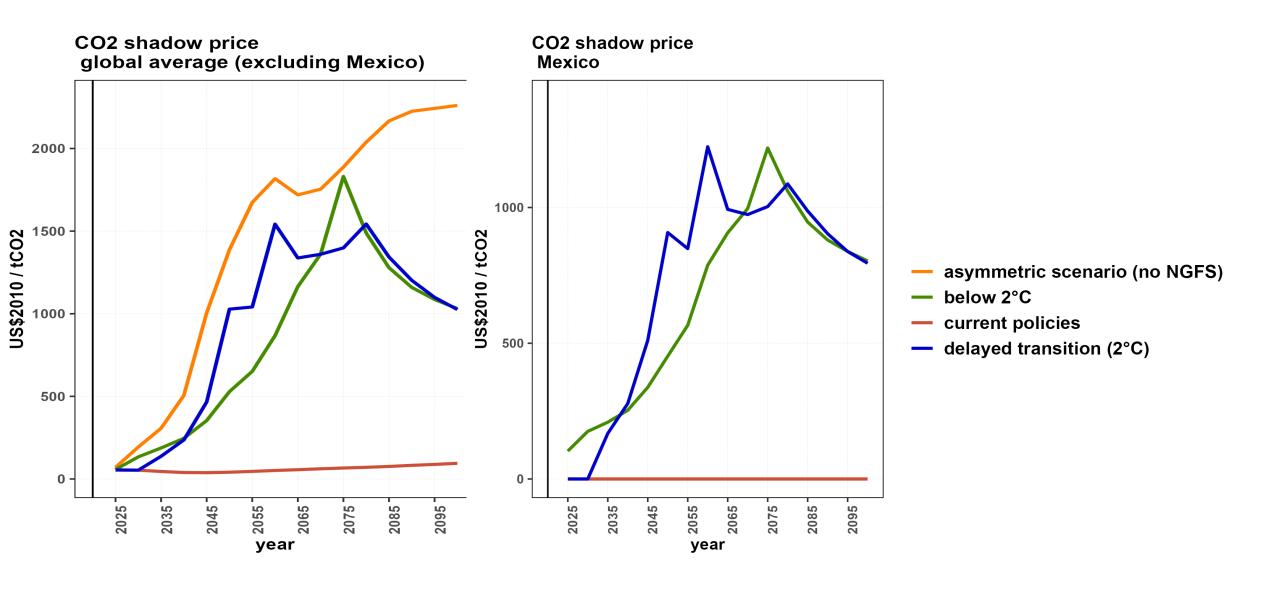

Taxes

Outputs: Macroeconomic variables, such as reserves, nominal/real exchange rates, social contributions, benefits, household debt, government deficit and debt, GDP, current account balance, gross/net foreign exchange reserve position, international investment, unemployment, among others.

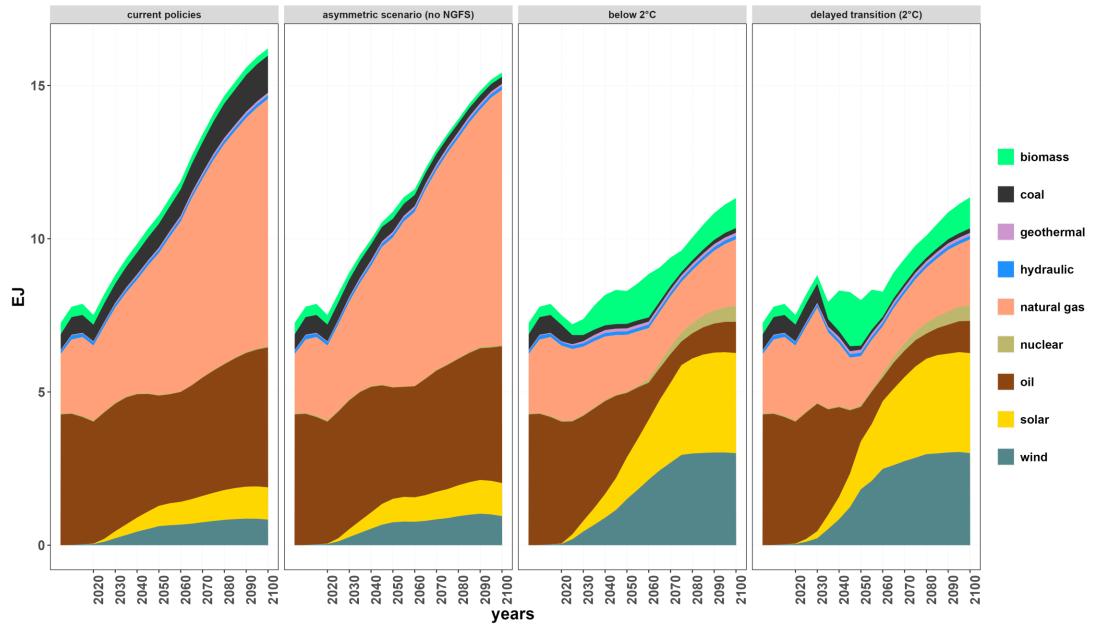

Global average temperature compared to pre-industrial levels

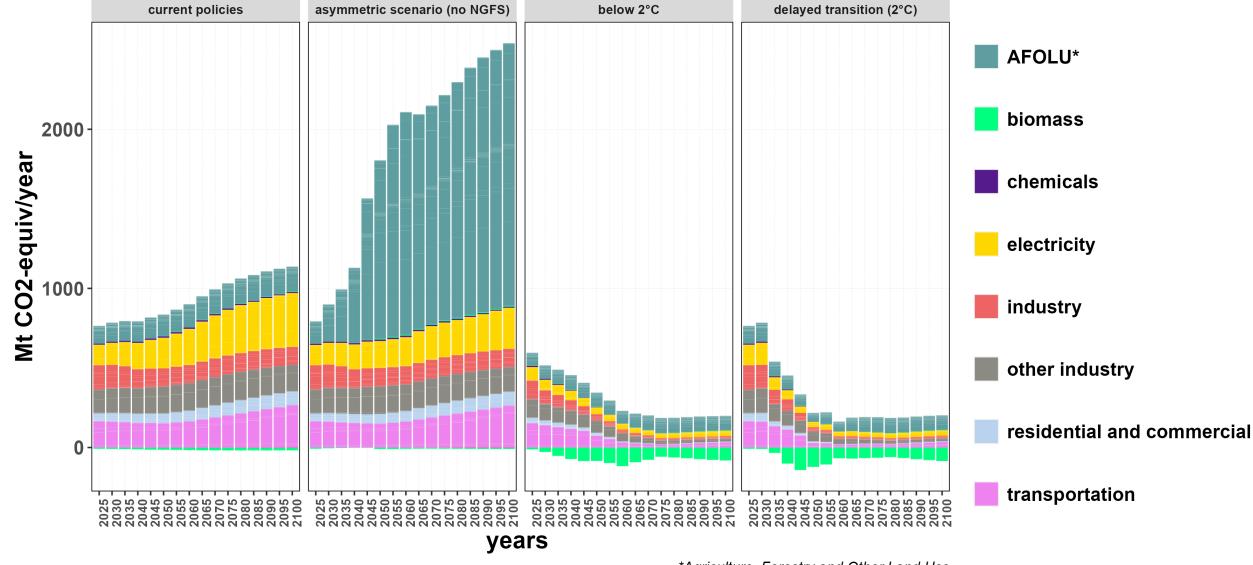

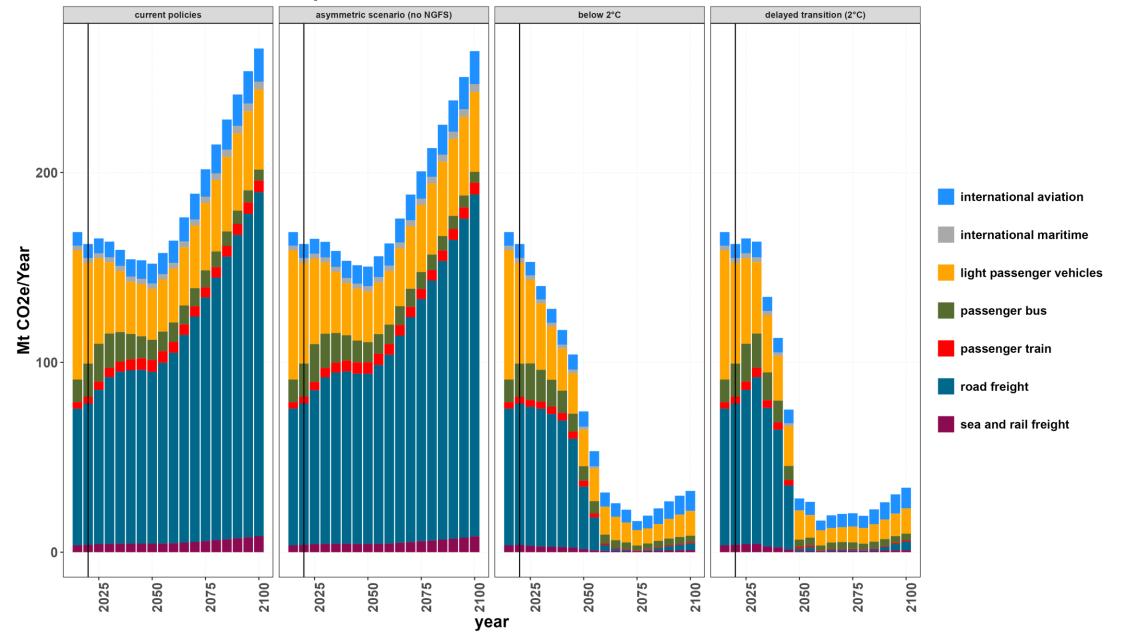

Primary Energy, Mexico

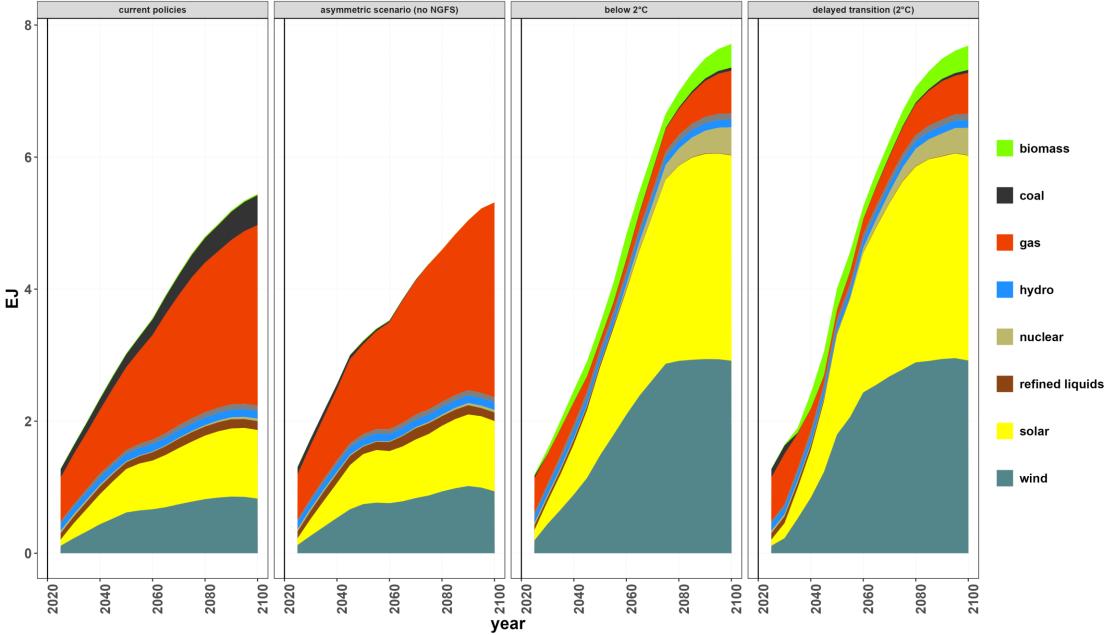

GHG emissions by sector - Mexico

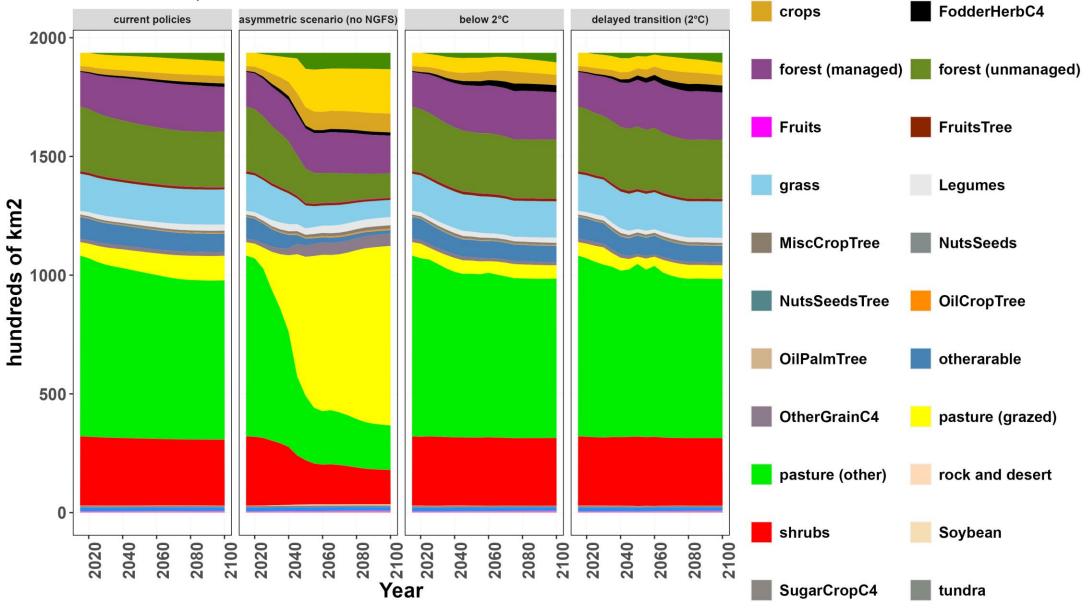

GHG Emissions - Transportation, Mexico

Electricity, Mexico

Land use, Mexico

WATER DEMAND

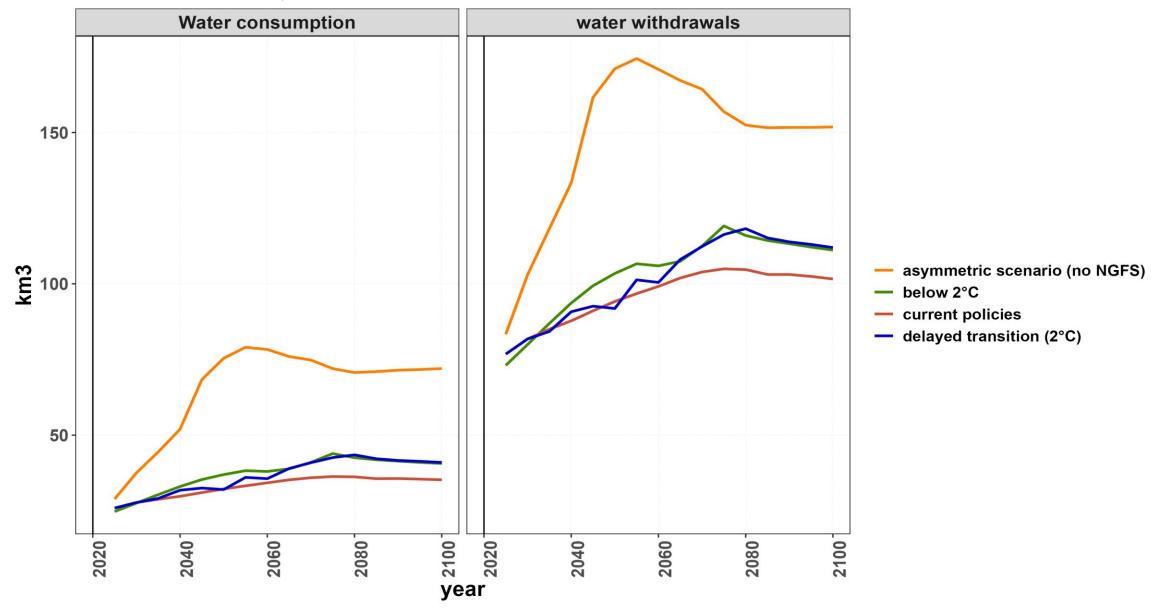

Water withdrawals

 Total amount of water taken from a water source (such as rivers, lakes, or groundwater) for any purpose (Vickers 2001). It includes both consumptive and non-consumptive uses. Non-consumptive uses typically involve returning the water back to the source after use, such as for cooling in thermal power plants.

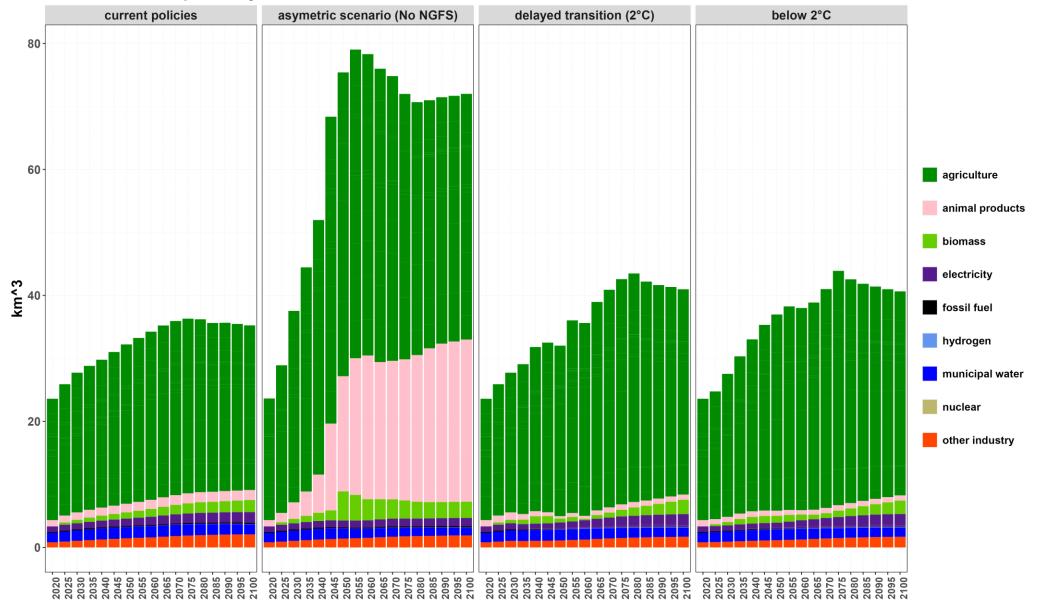

Water consumption

 Water use that permanently withdraws water from its source; water that is no longer available because it has evaporated, been transpired by plants, incorporated into products or crops, consumed by people or livestock, or otherwise removed from the immediate water environment (Vickers 2001).

Water Demand, Mexico

Water Consumption by sector

Climrisk

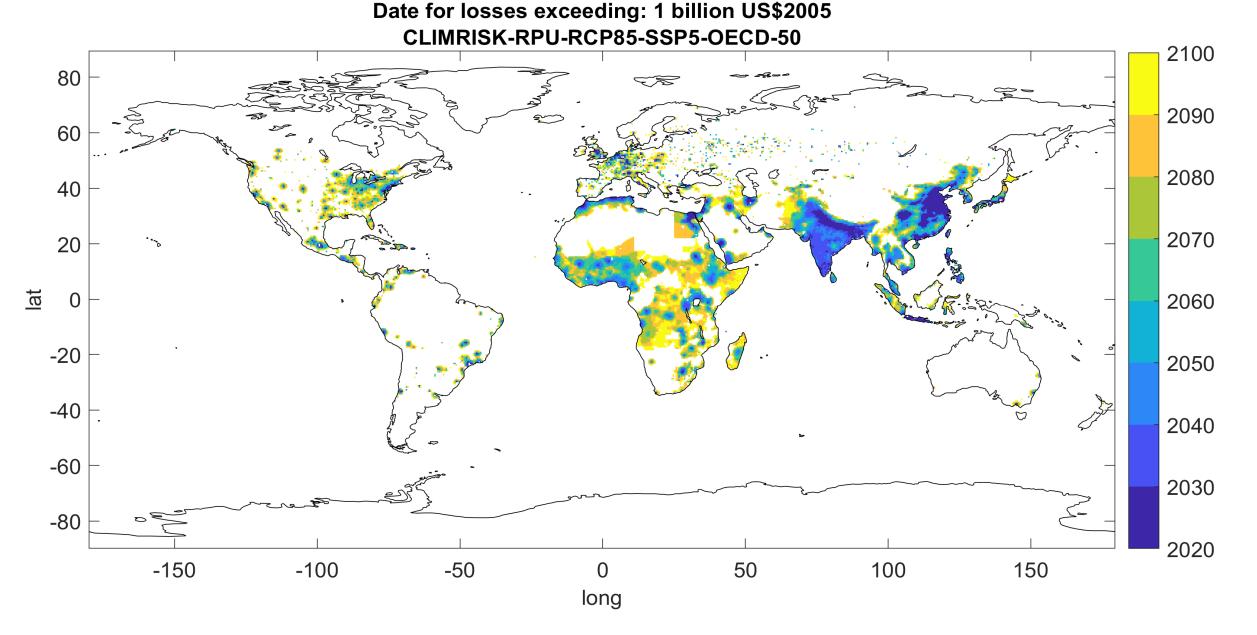

Present value of economic losses as % current GDP

World, NGFS current policies

Next steps

- The Scenario Analysis Pilot was launched on October 31st at the Climate Scenario Analysis Conference.
- Financial Institutions were invited to participate during the 1st quarter of 2024.
- 15 letters of interest were received and 10 institutions will be accepted (5 commercial banks, 2 development banks, 2 Afores and 1 insurance company).
- Execute the Bottom Up Pilot.
- Produce relevant reports.
